

The torque on a magnetic dipole in a B field is:

$$\boldsymbol{\tau} = \mathbf{m} \times \mathbf{B}$$

How will a small current loop line up if the B field points uniformly up the page?

A small chunk of material (the “tan cube”) is placed above a solenoid. It magnetizes, weakly, as shown by small arrows inside. What kind of material must the cube be?

- A. Dielectric
- B. Conductor
- C. Diamagnetic
- D. Paramagnetic
- E. Ferromagnetic

A solid cylinder has uniform magnetization  $\mathbf{M}$  throughout the volume in the  $x$  direction as shown. What's the magnitude of the total magnetic dipole moment of the cylinder?

A.  $\pi R^2 LM$

B.  $2\pi RLM$

C.  $2\pi RM$

D.  $\pi R^2 M$

E. Something else/it's complicated!

A solid cylinder has uniform magnetization  $\mathbf{M}$  throughout the volume in the  $z$  direction as shown. Where do bound currents show up?

- A. Everywhere
- B. Volume only, not surface
- C. Top/bottom surface only
- D. Side (rounded) surface only
- E. All surfaces, but not volume

A solid cylinder has uniform magnetization  $\mathbf{M}$  throughout the volume in the  $x$  direction as shown. Where do bound currents show up?

- A. Top/bottom surface only
- B. Side (rounded) surface only
- C. Everywhere
- D. Top/bottom, and parts of (but not all of) side surface (but not in the volume)
- E. Something different/other combination!

A solid cylinder has uniform magnetization  $\mathbf{M}$  throughout the volume in the  $\phi$  direction as shown. In which direction does the bound surface current flow on the (curved) sides?

- A. There is no bound surface current.
- B. The current flows in the  $\pm\phi$  direction.
- C. The current flows in the  $\pm s$  direction.
- D. The current flows in the  $\pm z$  direction.
- E. The direction is more complicated.

A sphere has uniform magnetization  $\mathbf{M}$  in the  $+z$  direction.  
Which formula is correct for this surface current?

- A.  $M \sin \theta \hat{\theta}$
- B.  $M \sin \theta \hat{\phi}$
- C.  $M \cos \phi \hat{\theta}$
- D.  $M \cos \phi \hat{\phi}$
- E. Something else

Predict the results of the following experiment: a paramagnetic bar and a diamagnetic bar are pushed inside of a solenoid.

- A. The paramagnet is pushed out, the diamagnet is sucked in
- B. The diamagnet is pushed out, the paramagnet is sucked in
- C. Both are sucked in, but with different force
- D. Both are pushed out, but with different force

A very long aluminum (paramagnetic!) rod carries a uniformly distributed current  $I$  along the  $+z$  direction. What is the direction of the bound volume current?

- A.  $\mathbf{J}_B$  points parallel to  $I$
- B.  $\mathbf{J}_B$  points anti-parallel to  $I$
- C. It's zero!
- D. Other/not sure

A very long aluminum (paramagnetic!) rod carries a uniformly distributed current  $I$  along the  $+z$  direction. We know  $\mathbf{B}$  will be CCW as viewed from above. (Right?) What about  $\mathbf{H}$  and  $\mathbf{M}$  inside the cylinder?

- A. Both are CCW
- B. Both are CW
- C.  $\mathbf{H}$  is CCW, but  $\mathbf{M}$  is CW
- D.  $\mathbf{H}$  is CW,  $\mathbf{M}$  is CCW
- E. ???

A very long aluminum (paramagnetic!) rod carries a uniformly distributed current  $I$  along the  $+z$  direction. What is the direction of the bound volume current?

- A.  $\mathbf{J}_B$  points parallel to  $I$
- B.  $\mathbf{J}_B$  points anti-parallel to  $I$
- C. It's zero!
- D. Other/not sure

A very long aluminum (paramagnetic!) rod carries a uniformly distributed current  $I$  along the  $+z$  direction. What is the direction of the bound surface current?

- A.  $\mathbf{K}_B$  points parallel to  $I$
- B.  $\mathbf{K}_B$  points anti-parallel to  $I$
- C. Other/not sure
